

# Telco Customer Churn Analysis

---

10Pearls Data Science Internship

Ali Muhammad Asad

# Table of Contents

---

1. Project Overview
2. Customer Churn Dataset
3. Module 1: Python – Data Processing and EDA
4. Module 2: AI Algorithms and Machine Learning
5. Module 3: SQL Analysis
6. Module 4: Model Deployment and API

# Project Overview

---

- The objective of this project is to analyze customer churn data from a telecommunications company, develop a predictive model capable of identifying customers who are likely to churn and manage the data via SQL.
- Churn refers to when a customer stops using the services of the telco, which can be due to various reasons such as poor service quality, high rates that are unable to meet the standard, etc.

# Customer Churn Dataset

---

- The data set was provided to us on our notion page as a google sheets, which was downloaded into a csv file
- It included raw information about:
  - Customers who left – Churn (target variable)
  - Services each customer used (phone, internet, etc)
  - Customer Billing Information
  - Customer Demographic Information

# Module 1: Python – Data Processing and EDA

# Methodology

---

1. Data Processing
2. Exploratory Data Analysis (EDA)
3. Feature Engineering
4. Correlation Matrix
5. SMOTE

# Data Processing

- Main libraries used:
  - Pandas, Seaborn, Matplotlib, imblearn
- The data was first loaded and inspected
- Very clean dataset
- No null values or any missing values

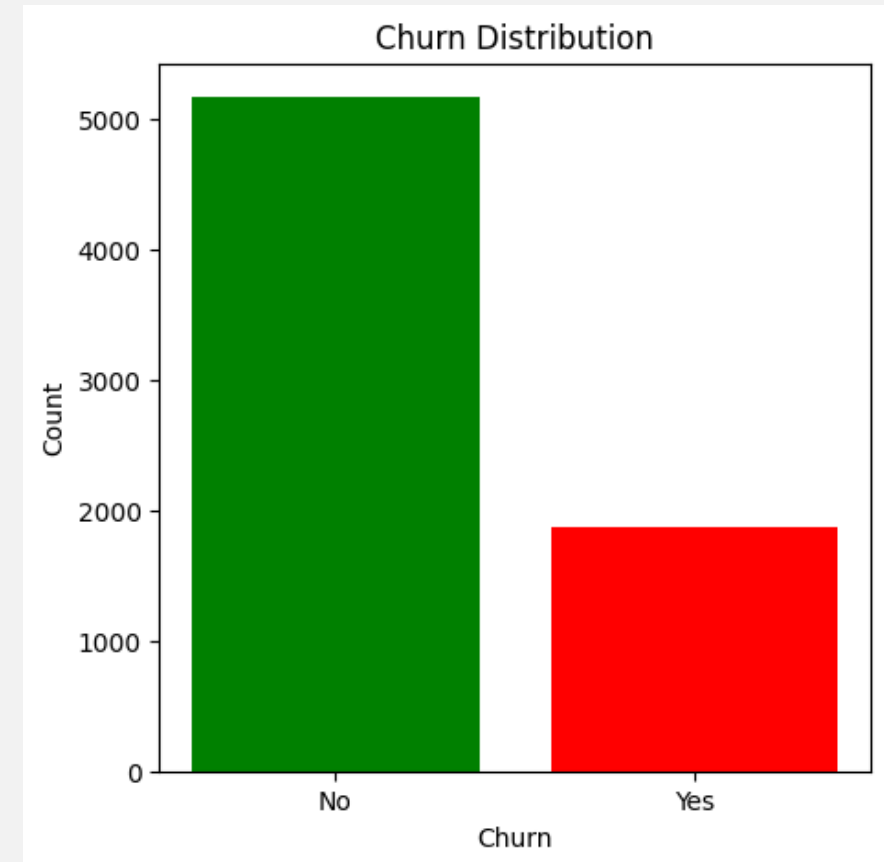

```
missing_values = df.isnull().sum()
missing_values[missing_values > 0]
df = df.dropna()
df.isnull().sum()
```

# Exploratory Data Analysis

## Target Feature Distribution

- Imbalanced distribution of target variable:
  - Churns: roughly 25%
  - Stays: roughly 75%
- Imbalanced distribution handled through SMOTE

# Distribution of Customer Demographics

- Males and Females have roughly the same churn rates
- More non-senior citizens
- Churn rates higher amongst non-senior citizens

# Contract Types and Churn

- Month-to-Month contract types show the highest amount of churn rates
- One and Two year contract types have the lowest churn rates
- Customers with longer contracts tend to stay loyal

# Churn vs Tenure, Monthly Charges, and Total Charges

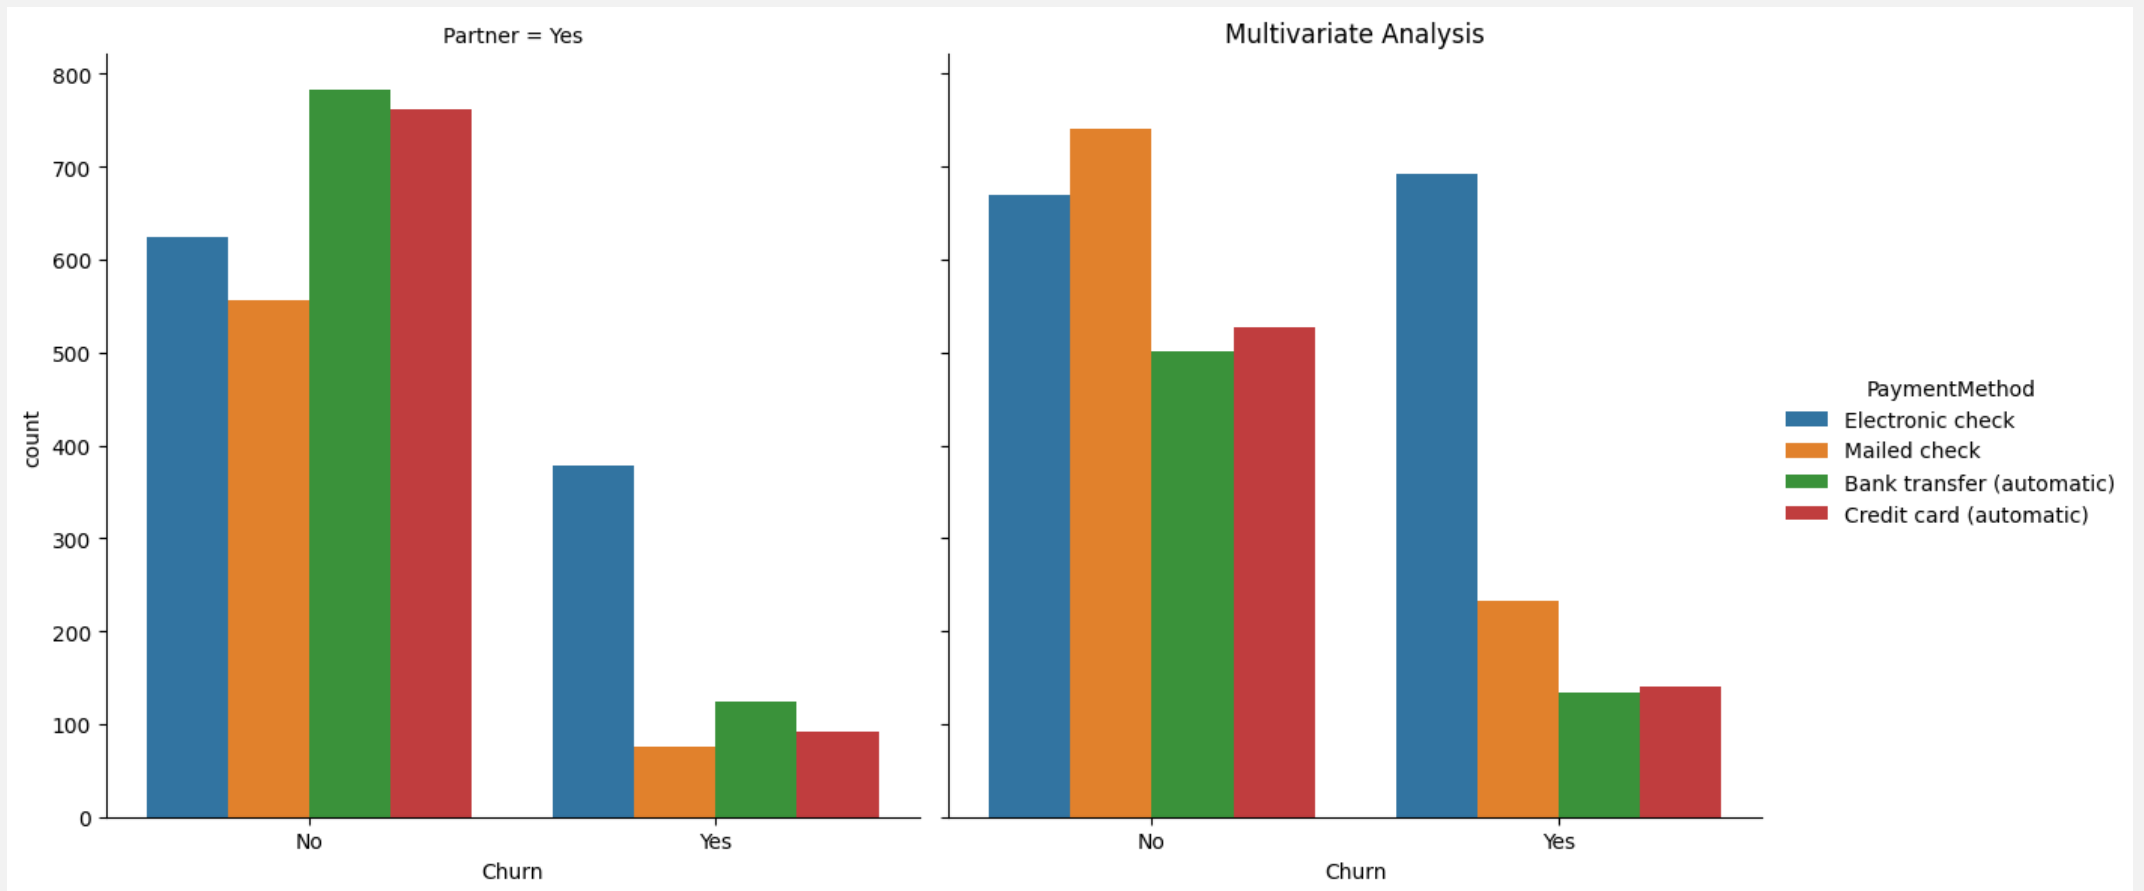

—

# Tenure, Monthly Charges, Total Charges

# Multivariate Analysis: Partners and Payment Methods

# Feature Engineering

---

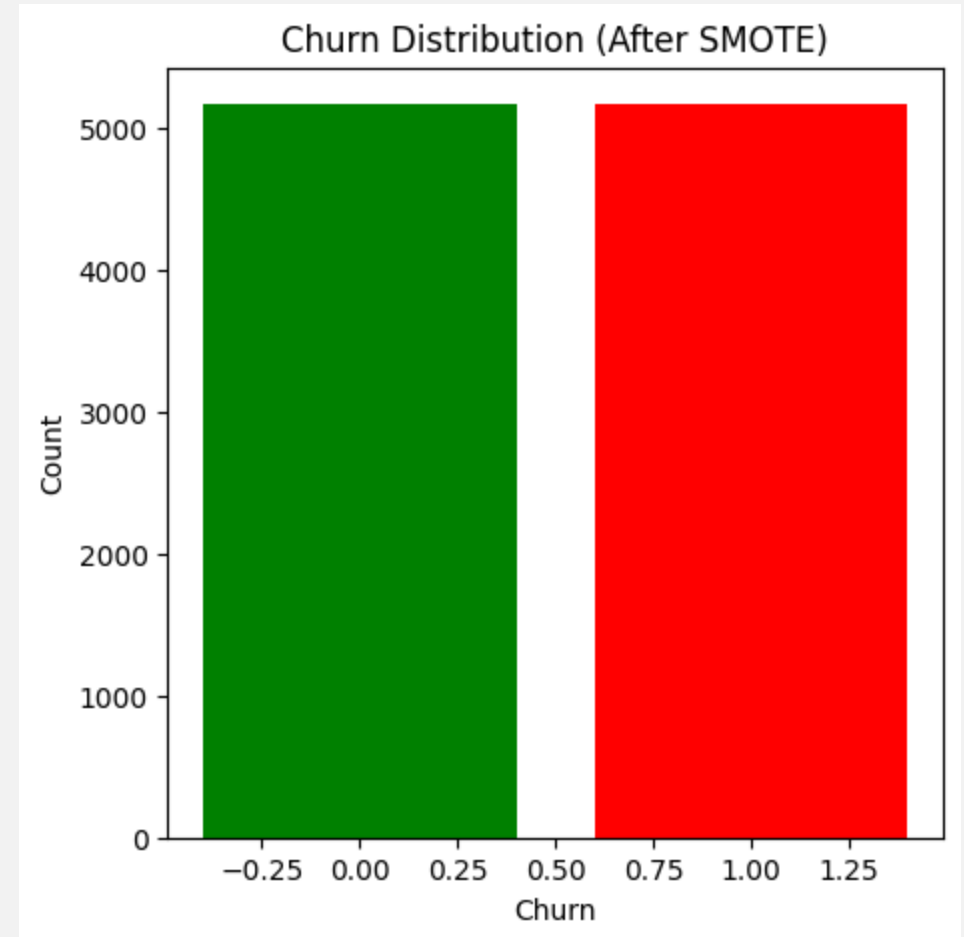

- Categorical data converted to numerical data
- Yes and No replaced with 1s and 0s
- Columns with categorical values split to introduce more features in numerical format
  - Payment Methods split
  - Gender split
- Numerical data easier to pass to and train machine learning model on

# SMOTE

- SMOTE used to balance the uneven distribution of the target variable – Churn
- Balances the dataset by introducing more synthetic data from the minority class, thus prevents the machine learning model to overfit on the majority class
- Improved performance

# Module 2: AI Algorithms and Machine Learning

# Used Machine Learning Models

- 
- Logistic Regression
  - Decision Trees
  - Random Forest
  - Gradient Boosting
  - Support Vector Machine
  - XGBoost
  - Voting Classifier

## Performance Metrics:

- Accuracy
- Precision
- Recall
- F1-Score
- ROC AUC

Classification Reports,  
Confusion Matrix,  
Precision Recall Curves,  
ROC AUC Curves

# Model Training Steps

---

- Data split into train and test set (70-30)
- Model trained on the dataset
- Performance evaluated
- Hyperparameters tuned:
  - Parameters grid
  - GridSearchCV
- Best classifier saved
- Performance compared
- Best model saved as a pickle file

# Summary – Confusion Matrices

Confusion Matrix - Logistic Regression (Tuned)

Confusion Matrix - Decision Tree (Tuned)

Confusion Matrix - Random Forest

Confusion Matrix - Gradient Boosting (Tuned)

Confusion Matrix - Support Vector Machine

Confusion Matrix - XGBoost (Tuned)

Confusion Matrix - Voting Classifier

# Model Rankings – Based on Metrics

- 
- Metrics evaluated on:
    - Accuracy, Precision, Recall, F1-Score, ROC AUC
  - Best Models (rankings based on the highest value given by the mean of the above metrics):
    - Voting Classifier
    - Random Forest
  - Important Features using SHAP:
    - Contracts (One and Two years)
    - Monthly Charges
    - Tenure

# Module 3: SQL Analysis

# Database, Schema and Design

- PostgreSQL and pgAdmin4 used
- Schema generated over pgAdmin4
- Connected to python
- Raw data and prediction results stored in the database
- Queries executed for analysis

# Analysis on Contracts, Payment Methods and Internet Services

---

- Month-to-Month contracts recorded the highest predicted churn rate of 43.40% (1682 out of 3875 customers)
- Two-year contracts recorded the lowest predicted churn rates of 1.90% (32 out of 1685 customers)
- Electronic Check had the highest predicted churn rate of 46.64% (1103 out of 2365 customers)
- Credit Cards have the lowest – 14.33%
- Fiber Optic internet service had the highest predicted churn rates of 42.24% (1308 out of 3096 customers)
- Customers with No Service are least likely to churn – 7.1%

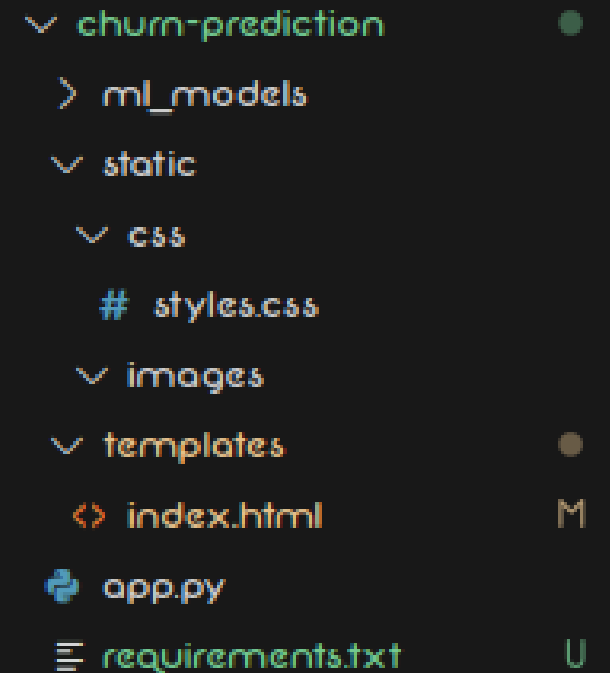

# More Analysis

- 
- The total revenue was \$16056168.70
  - Total revenue generated by churned customers: \$2862926.90
  - The customers with the lowest tenures (1-5 months) had the highest predicted churns

# Module 4: Model Deployment

# Flask Web App

- Flask used to deploy the models over a web app
- app.py -> Flask API
  - Loads saved models
  - Receives customer input
  - Computes and returns predictions
- APIs developed for the following functionalities:
  - Health Check: status of API
  - Prediction: receive data and return prediction
- APIs tested via Curl

A screenshot of a file explorer interface showing the directory structure of a project named 'churn-prediction'. The structure includes a 'ml\_models' directory, a 'static' directory containing 'css' (with 'styles.css') and 'images', a 'templates' directory with 'index.html', and two main files: 'app.py' and 'requirements.txt'. Each item has a corresponding icon and a status indicator on the right.

```
▼ churn-prediction ●
  > ml_models
  ▼ static
    ▼ css
      # styles.css
    ▼ images
  ▼ templates ●
    <> index.html M
  + app.py
  ≡ requirements.txt U
```

# Telco Customer Churn Prediction

Predict whether a customer will churn based on their demographics, service usage, and billing information.

## Customer Demographics

Gender:

Male

Senior Citizen:

No

Partner:

No

Dependents:

No

Tenure:

2

## Billing Info

Contract:

Month-to-Month

Paperless Billing:

Yes

Payment Method:

Mailed Check

Monthly Charges:

53.85

Total Charges:

108.15

## Services Used

Phone Service:

Yes

Multiple Lines:

No

Internet Service:

DSL

Online Security:

Yes

Online Backup:

Yes

Device Protection:

No

Tech Support:

No

Streaming TV:

No

Streaming Movies:

No

Predict

Model	Prediction
Voting Classifier	Customer Churns
XGBoost	Customer Churns
Random Forest	Customer Churns
Gradient Boosting	Customer Churns
Logistic Regression	Customer Churns
Decision Tree	Customer Churns
SVM	Customer Churns

Customer info

Predictions

```
@app.route('/api/predict', methods=['POST'])
def api_predict():
    data = request.json
    data = form_to_numeric(data)

    # Make predictions
    predl = {model_name: show_pred(model.predict(data)[0]) for model_name in model_names}

    return jsonify(predl)

@app.route('/api/health', methods=['GET'])
def health_check():
    return jsonify({'status': 'Thumbs Up guys'}), 200
```

# Flask Web App - Demo
